Research Overview

At the NetDB research group at the University of Pennsylvania, I lead a team that applies data-centric techniques and formal methods to design, analyze, and implement distributed systems. Our work spans databases, networking, security, operating systems, programming languages, and formal methods, and has received multiple Best Paper Awards at top conferences including USENIX NSDI, IEEE ICDE, EDBT, ACM HPDC, and ACM ICAC. Our research is supported by the National Science Foundation (CISE IIS, CNS, CCF, TC, SBIR) and the Department of Defense. I co-founded two companies: Netsil, acquired by Nutanix, and Termaxia, acquired by Frontiir Inc. Over the years, I have supervised 18 Ph.D. students, 3 postdoctoral researchers, and numerous undergraduate and master’s students. My former students and postdocs have gone on to successful careers, including earning tenure at Georgetown University and Temple University, joining as tenure-track faculty at the University of Toronto, Stony Brook University, Illinois Institute of Technology, ShanghaiTech University, and City University of Hong Kong, and receiving several prestigious dissertation awards.

Coursework Development

URL: <https://boonloo.cis.upenn.edu/about/teaching/>

- **CIT 5950 Online: Computer Systems Programming**
Introduces foundational concepts in computing systems. The first 75 percent covers operating system concepts including processes, threads, inter-process communication, traps, interrupts, scheduling, virtual memory, and file systems. The final 25 percent introduces networked systems, the Internet, and network programming. Students program in C and gain experience with system calls, process and thread manipulation, signal handling, and network communication. Offered as a core course in the MCIT Online program
- **CIS 8000: Software-defined Data Centers**
Developed a graduate-level seminar focusing on the foundations of software-defined data centers, with emphasis on innovations in SDN, NFV, and virtualization for compute and storage. The course includes research paper readings, discussions, programming assignments, and a final project using open-source SDN and NFV platforms to develop automation solutions for data centers. Industry speakers from Brocade, Comcast, and Juniper Networks join to discuss practical applications.
- **CIS 3800: Operating Systems**
A required core course for CIS undergraduates. Created a new project sequence based on PennOS in which students build a complete user-space operating system. A paper describing PennOS appeared in ACM SIGOPS Operating Systems Review. Course evaluations and enrollment have reached their highest levels in the past three years since CIS 381 was decoupled.
- **CIS 5050: Distributed Software Systems**
In Spring 2008, redesigned the core course for advanced undergraduates and first-year graduate students. In addition to distributed computing fundamentals, the course introduces topics related to large-scale data management in cloud platforms and data centers. The semester-long project involves building a POP3 and SMTP compliant mail server and extending it for fault tolerance and distribution, later evolved into a distributed chat server project. The head TA received the Outstanding Teaching Assistant Award for 2008 to 2009.
- **CIS 5530 / TCOM 5120: Networked Systems**
Created an advanced undergraduate and graduate networking course cross listed with TCOM. Students work in teams to develop routing protocols and a Chord Distributed Hash Table, demonstrated on a cluster using the ns 3 network simulator. Students also build a p2p keyword search engine above their Chord layer, based on the original SIGCOMM publication. Work from this class led to the PennSearch paper presented at the SIGCOMM Education Workshop. Enrollment grew from 34 in Spring 2008 to 107 in Spring 2012. A version of the course was later developed for MCIT Online in 2022.
- **CIS 7000: Networking meets Databases**
Developed a course exploring research at the intersection of networking and data management. The first offering attracted PhD students in networking, databases, and security. Several final project papers were later published in security, peer to peer, networked data management, and mobile networking workshops, with several follow up conference submissions.
- **CIS 8000: Rigorous Internet Protocol Engineering**
Introduced a graduate course in Fall 2011 covering formal modeling, high assurance protocol design, verification, and protocol programming languages. Topics include mathematical models of Internet protocols, domain specific languages for specifying protocols, and verification techniques for correctness and security. Case studies include IP routing, BGP policy configuration, secure BGP, transport protocols, overlay networks, and OpenFlow based

protocol development. Students gain experience with formal modeling and verification tools such as model checking and automated theorem proving.

- **CIS 19X Mini Course Series**
Administrator for the CIS undergraduate mini course sequence consisting of half credit programming courses in C++, C#, Python, Unix/Linux and later Haskell, iPhone programming, and Ruby on Rails. Typical enrollment is approximately 30 students per course, with the Unix/Linux course as high as 90 students. Courses are taught weekly by graduate students, providing practical programming experience for undergraduates and valuable instructional experience for graduate instructors. From 2010 to 2012 the program saw expansion in enrollment, new course offerings, industry guest instructors, offerings in both Fall and Spring, and several teaching awards for instructors and TAs.
- **CIS 4000 / CIS 4010: Senior Design Project Sequence**
Coordinate the year long capstone sequence in which students propose, design, and implement a substantial project in software, hardware, or theory. CIS 4000 (Fall) requires project abstracts with adviser approval, an intermediate report, and a progress presentation. CIS 4010 (Spring) concludes with a final written report and a project presentation and demonstration. Evaluations are based on technical writing, oral communication, and project completion, assessed jointly by advisers and the course instructor. Since assuming leadership of the sequence, course and instructor evaluations have shown significant improvement relative to long term historical averages.
